

Inkwell

SPACETIMEDB LAUNCHPAD · NYC TECH WEEK 2026

A comic, Drawn live.

Set a genre, a cast, a setting

Watch each scene draw itself

Invite co-directors

Nudge the story before the next one begins!

You are the director. The agents draw.

01

Collab & Direct

Set genre, location, and a cast of characters. Inkwell takes it from there. You're the showrunner, not the typist. Share your creation.

02

Watch it draw

Each scene generates as a complete comic page.
As SpacetimeDB rows commit to the database.

03

Nudge & fork

Steer the story between scenes. Go back to any past scene and branch a parallel timeline, what if the story had gone differently?

Three agents. Per scene.

01

Script Agent

Claude API

Reads character memory, nudge directives, and genre rules.
Writes the full scene script as structured object.

02

Art & Voice Agent

OpenAI

Receives the entire scene script in one call.
Generates a complete B&W comic page. Narrates the scene & also takes voice commands (Nudges)

03

Sync Layer

SpacetimeDB

Acts commit as rows. Every client subscribes. Page draws live as rows arrive. No polling. No websocket glue code.

What if the story had gone differently?

Go back to any past scene. Apply a different directive. Watch the story branch from that moment as a parallel timeline.

Both the original and the fork exist simultaneously readable comic pages in the same session. Switch between them in the sidebar.

WHY THIS IS NATIVE TO SPACETIMEDB

Live collaboration | Real time subscriptions

No conflicting edits | Built-in concurrency

No lost progress | Checkpointed workflows

Shared story state | Unified data model

Faster development | All-in-one Backend

STDB data model was our branching system.

Inkwell

Direct your story.

Noir · Horror · Comedy · Fantasy · Sci-Fi · Western · Romance · Thriller
